The theorems of real analysis rely intimately upon the structure of the real number line. The real number system consists of an uncountable set \mathbb{R} , together with two binary operations denoted $+$ and \cdot , and an order denoted $<$.The operations make the real numbers a field, and, along with the order, an ordered field.The real number system is the unique complete ordered field, in the sense that ...

ngbe a real sequence such that $x_n > 0$ for all n . Show that if x_n converges, then its limit is non-negative. A proof by contradiction might be helpful here. Solution 2. Assume, to the contrary, that $x_n < 0$ where $p < 0$. Note that $p = 2 > 0$. Then, since $x_n > p$, there exists some N such that for all $n > N$, $|x_n - p| < p = 2$. Thus, for all $n > N$, $p = 2 < x_n < p = 2$:

In complex analysis, the Hardy spaces (or Hardy classes) H^p are certain spaces of holomorphic functions on the unit disk or upper half plane.They were introduced by Frigyes Riesz (), who named them after G. H. Hardy, because of the paper ().In real analysis Hardy spaces are certain spaces of distributions on the real line, which are (in the sense of distributions) boundary values of the ...

A sequence of real (or complex) numbers is said to converge to a real (or complex) number c if for every $\epsilon > 0$ there is an integer $N > 0$ such that if $j > N$ then $|a_j - c| < \epsilon$. The number c is called the limit of the sequence and we sometimes write $a_j \rightarrow c$. If a sequence does not converge, then we say that it diverges.
